Custom Sizes to fit work cell

Electrical Cables run under mat

Milagon Solves Ergonomic Issues!

In 2008 a manufacturer of Aluminum Extrusions called on one of our local dealers looking for some help with Anti-Fatigue Matting. They were experiencing several issues with their current brand. These issues included: mats burning when parts were dropped, mats curling up, current mat becoming too hard, mats became slippery, mats did not cover entire work cell and mat life cycle was only 6 - 8 month.

After reviewing their application we suggested they use The Milagon Open Comfort Grit Matta Product to address their issues. The Milagon Product is made from Recycled PVC, thus it will not allow oil to penetrate it, it is heat resistant, and it will not break down due to oil or cutting fluids. The Matta product is designed in 20 x 20 tiles with 4" yellow safety borders, so we were able to create sizes that adjust to their work cells. The carbon fiber grit surface prevents the operators from slipping by providing excellent traction. An additional bonus feature was the ability to run electric and hydraulic cables under the tiles with out causing any elevation change to the surface. This is accomplished by routing the cable between our compression columns on the under side of the tiles.

All of these features combined with Milagon's superior 10 year warranty allowed the dealer to earn a large amount of business with this and several additional clients.
